

UDS Enterprise 2.1 Official Release is now available for download

The new version of UDS Enterprise connection broker is now available for download on our [website](#). UDS Enterprise 2.1 embodies important innovations designed to improve productivity and facilitate the work of IT administrators and platform users. Among the many improvements we highlight:

Support for new connection protocols: PCoIP and X2Go. With the integration of the protocol developed by Teradici, PCoIP, UDS Enterprise allows to use design tools with high graphic demand in virtual desktops, certifying a maximum graphic quality. The X2Go Open Source protocol for Linux brings a diversity of features that are difficult to find in other protocols, such as the ability to enable audio and video on virtual desktops or redirect USB storage devices, while providing a stable and fast remote connection.

Support for new versions of service providers such as Citrix XenServer 7, Nutanix Acropolis 5.1, OpenNebula 5, OpenStack Ocata; oVirt 4.1 and VMware vSphere 6.5.

Support for new functionalities for application session virtualization with RDS, which now enables direct Active Directory (AD) credential redirection to application servers.

Integration of new RDP connection protocol options for Windows and Linux that enhance the user experience, such as font smoothing, desktop composition, or CredSSP support.

Improved HTML5 connectivity with new options to choose the quality/consumption ratio that best suits the needs of each user.

Novelties in the management of Static Machine Provider. A new service has been added to facilitate the access of N users to the same server.

Major improvements of the UDS Actor, including the incorporation of new mechanisms to add machines to domains.

What's new in the Dashboard. New summary and information tabs. Quick attachments have also been added to various items, which further facilitate the task of the platform managers.

New language pack: Arabic.

To the subscribers who wish to upgrade to this new version, you only need to access to [My UDS](#), download and install the appliances corresponding to the hypervisor you want to use.
