

UDS Enterprise graphical customization

UDS Enterprise allows customization in order to provide the tool with the corporate appearance requested by each client. You will be able to modify both the general appearance of the different administration pages and the web access dashboard.

The customization process is very simple: you only have to modify or change the general *Theme* of the app for any *Theme* you would like to use in HTML format. In order to do that, you may follow these instructions:

Changing application *Theme*

The customization process of the different access web pages of an user is very simple. However, you should keep in mind the following issues:

- Changing “UDS Theme” in UDS Enterprise advanced configuration:

To indicate to the UDS system what *Theme* has to use for the different pages, you should provide the right name of the folder which contains the HTML pages.

In the administration, select “Tools” and access “Configuration”. Once you access the system advanced configuration, look for “UDS Theme” and indicate the name of the folder containing the new HTML pages. The system names this folder *html5* by default.

UDS Theme

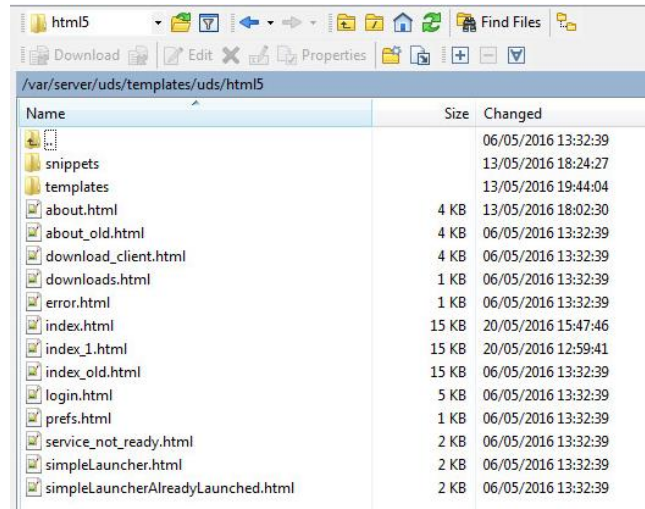

It is possible to edit directly the existing “html5” folder, but before making any modification, it is recommended to run a backup which allows restoring the original configuration in case you make any wrong task, in order not to lose full access to the system.

- HTML files location:

The system uses the following location for this folder by default:
`/var/server/uds/templates/uds`

In case you create a new folder, it must be placed in the same location where the folder is by default

Inside the *html5* folder you will find the *.html* pages where you can make modifications to customize the user login pages, preferences, available services, downloads, warnings...

- **Editing server files:**

Files hosted on the server (location is described in the previous section) must be edited so that customization is valid and visible for all users. In order to do that, you should connect the server and edit the files (it is recommended to run a backup before editing).

- **Editing files:**

This task requires web pages editing skills (html, html5, css, etc...).

In order to edit a text we should edit the HTML files. To do this, you can use a simple text editing program, like Notepad. There are also many other HTML editing programs which will make it more easy and add the possibility of editing both the code and text in the pages.

If you use new images, you should store them at: `/var/server/static/img`

All pages can be modified. For instance, if you want to modify the login screen of a user, you have to modify the file *login.html*. In case you want to modify the screen "assigned services to a user", you have to modify the file *index.html* and you can do the same operation with the remaining pages

It is important to keep in mind that if you have created a new folder and you have modified the “UDS Theme” in the advanced configuration, you must modify the “extends” route with the new name of the folder.

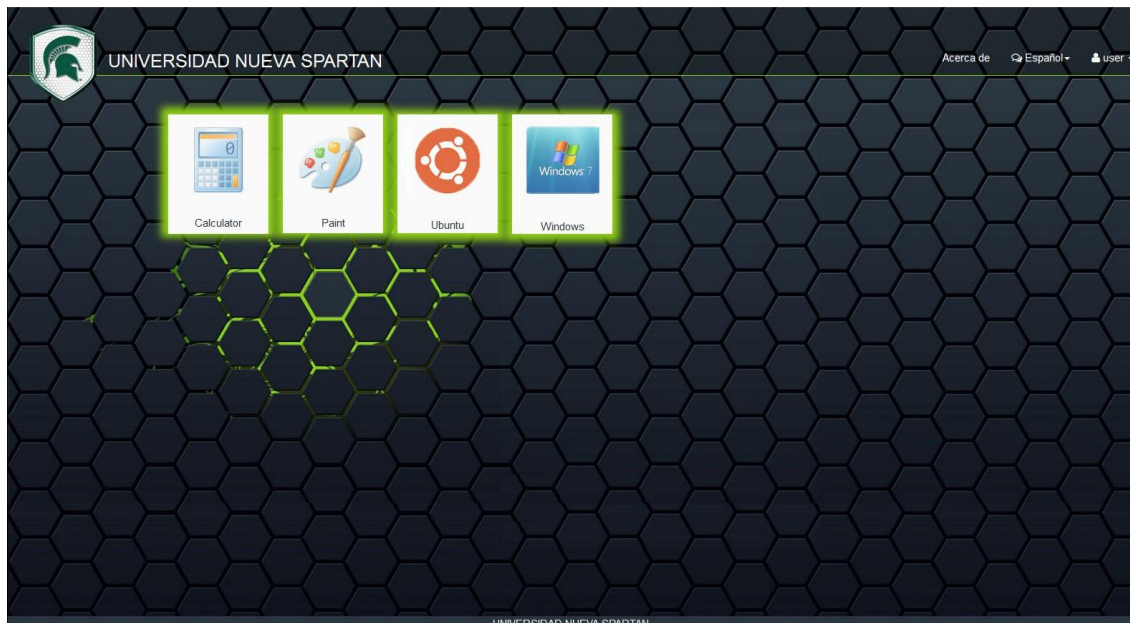

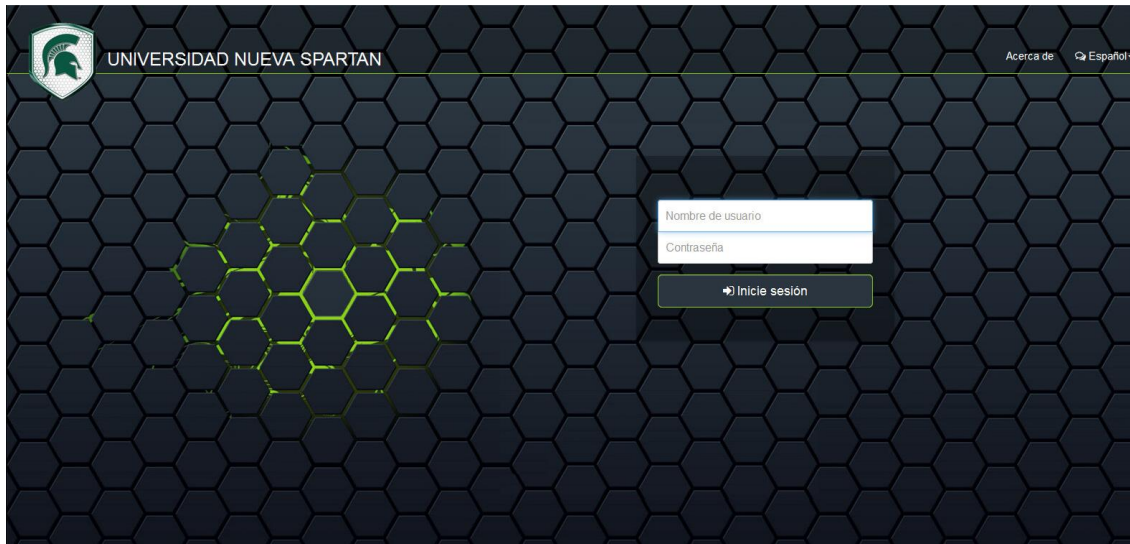

```
/var/server/uds/templates/uds/html5/login.html - root@192.168.11.10
{& extends "uds/html5NEW/templates/base.html" &}
{& load i18n static/html5 &}

{& block title &}& trans 'Welcome to UDS' &}{& endblock &}

{& block js &}
<script src="{& get_static_prefix &}js/PluginDetect_Java.js" type="te
<script type="text/javascript">
    function isJavaAvailable() {
```

Examples of UDS Enterprise graphical customization

Updating UDS Enterprise

When you update the system, you must make a copy of all the folders/files which have been modified/created before switching off the UDS Server Virtual Appliance.

Once the new updated UDS Server machine is deployed, copy again the folders/files you have previously saved.

You must keep in mind that in case you don't take this step, the theme and icons by default will be restored after each software update.

Support and professional services

VirtualCable sells UDS Enterprise through a subscription model, including product support and updates in segments based on number of users.

Additionally, VirtualCable offers a broad portfolio of professional services to install and configure UDS Enterprise and other virtualization technologies.
